INSTALLATION TIPS

1. Due to the inside of CAT5 cable containing pairs of wires twisted at different rates, and the different quality on the cable itself and installation, different signal arrival time may occur at each-pair. If there is a big difference at arrival time, that will cause RGB skew status. This is seen on the monitor as separation, or lack of convergence in colors. Normally it happens on long CAT 5 cable runs.

2. Recommend to use following cabling design to reduce skew status, and to add special made "skew immunized adaptor" (2 pieces included at the package).
